# ABOUT PROJECT

★ ★ ★ The FISAT Gateway Management System is a comprehensive digital solution designed to replace the traditional manual processes of managing gate-related activities in our college. Developed using the MERN stack (MongoDB, Express.js, React.js, Node.js) for the web application and React Native for mobile accessibility, the system ensures real-time updates and centralized management. Key features include automated visitor and student movement tracking, notifications for wardens, real-time alerts for parents regarding student departures, and streamlined staff gate transactions using ID card swipes. By digitizing operations, the project enhances efficiency, accuracy, and security, transforming how gateway activities are managed within the campus.

# OBJECTIVES

## Digitize Record

Replace the existing manual system of maintaining physical record books with a digital system for efficient and secure management of visitor, student, and staff movement records.

## Data Accuracy and Accessibility

Minimize errors caused by manual entries and provide instant access to accurate records for administrators, wardens, and other authorized users.

## Improve Communication

Facilitate real-time notifications to parents and watchmen regarding student movements, ensuring transparency and better communication.

## Eco-Friendly Practices

Reduce the usage of paper by transitioning to a fully digital system, contributing to environmentally sustainable practices within the campus.

## Streamline Hostel Management

Enable wardens to digitally log student entry and exit details, reducing dependency on physical slips and enhancing the approval process.

# SYSTEM STUDY

- Relies on traditional paper-based record-keeping methods for managing gate-related activities.
- No real-time notifications or updates for parents regarding student movements.
- Prone to human errors, leading to inaccurate or incomplete records.
- Time-consuming process for wardens and watchmen to update and retrieve information.

- Automated message systems to notify concerned parties (parents, watchmen) about significant activities, such as student movements or visitor approvals.
- For Watchmen: Instant notifications to watchmen about warden-approved student movements, eliminating delays caused by paper slips.
- For Parents: Automated SMS or email notifications to parents whenever a student exits the campus, improving transparency and communication.

# MODULES

1

## VISITOR MANAGEMENT

Record visitor details, view visitor logs, generate visitor passes.

2

## HOSTEL STUDENT MANAGEMENT

Record in-and-out details for men's and women's hostels, notify watchman and parents. Automated SMS/Email notifications for permissions and updates.

3

## DAILY REPORTING MODULE

Watchman records daily activities, admin reviews reports.

4

## STAFF MOVEMENT TRACKING

Log staff movements using ID card swiping via React Native.

5

## ADMIN MODULE

View reports, manage user access, monitor all records.

# TOOLS AND TECHNOLOGIES

- Front End : React.js , React Native
- Back End : Node.js , Express.js
- DataBase : MongoDB

# CONCLUSIONES

The FISAT Gateway Management System offers a modern, automated approach to managing gate-related activities, addressing the limitations of the traditional manual system. By leveraging the MERN stack and React Native, the system ensures real-time updates, streamlined processes, and enhanced accuracy in tracking movements and records. With features like automated notifications, parent alerts, and centralized reporting, this project not only improves operational efficiency but also strengthens campus security. It serves as a scalable and reliable solution to meet the evolving needs of institutional management.
